

NOTE: You will need to change the path directories in the STATA do files.

“Data prep inequality.do” – Stata do file used to prepare the data, compiling it from various sources into the files subsequently used in the analysis. These files used in the analysis are provided (but not the source files, which can be obtained from the various data sources).

“After imputation.do” – Stata do file used to prepare the 10 ISSP imputation files produced using Amelia prior to their analysis using multiple imputation.

“Analysis.do” – Stata do file used to conduct the analysis. NOTE: You will not want to run the whole file at one time: the ordered probit regressions using multiple imputation are very slow to compute.
